Suggested Lesson Structure

- Fluency Practice: (10 minutes)
- Application Problem: (5 minutes)
- Concept Development: (35 minutes)
- Student Debrief: (10 minutes)
- Total Time: (60 minutes)

Fluency Practice (10 minutes)

- Break Apart Numbers 1.OA.6 (4 minutes)
- Change 10 Pennies for 1 Dime 1.NBT.2 (4 minutes)
- Happy Counting by Tens 1.NBT.5 (2 minutes)

Break Apart Numbers (4 minutes)

Materials: (S) Personal white boards with break apart numbers template

Note: Reviewing decomposing numbers 5–9 supports Grade 1’s required fluency of adding and subtracting within 10 and is an essential skill in order to apply the Level 3 addition strategy of making ten. If students struggle with this activity, consider repeating it in lieu of some of the fluency activities that provide practice with numbers to 20 and beyond.

Students complete as many different number bonds as they can in one minute. Take a poll of how many students completed all decompositions for 5, 6, etc., and celebrate accomplishments.

Change 10 Pennies for 1 Dime (4 minutes)

Materials: (T) 10 pennies, 1 dime (S) 10 pennies and 1 dime per pair

Note: This activity helps students to see that 10 cents is equal to 1 dime just as 10 ones are equal to 1 ten. This fluency activity is necessary to prepare students to utilize coins as abstract units that represent tens and ones in G1–M1–Lesson 6.

Lay out 10 pennies into 5-groups as students count (1 cent, 2 cents, etc.). Make sure students include the unit as they count.
Lesson 1

NYS COMMON CORE MATHEMATICS CURRICULUM

Lesson 1: Compare the efficiency of counting by ones and counting by tens.

Date: 3/13/14

Lesson 1:

Note: Reviewing Happy Counting by Tens prepares students to recognize the efficiency of counting groups of 10 in today’s lesson.

Happy Counting by Tens (2 minutes)

Note: Reviewing Happy Counting by Tens prepares students to recognize the efficiency of counting groups of 10 in today’s lesson.

Happy Count by tens the regular way and Say Ten way from 0–120. To really reinforce place value, try alternating between counting the regular way and the Say Ten way.

Application Problem (5 minutes)

Joy is holding 10 marbles in one hand and 10 marbles in the other hand. How many marbles does she have in all?

Note: This problem applies a doubles fact that is familiar to most students. Circulate and notice students that may need to count on to add the 2 tens. During the Debrief, students will relate the Application Problem to the efficiency of counting by tens instead of counting by ones.

Concept Development (35 minutes)

Materials: (T) 40 linking cubes (2 colors, 20 of each), projector (S) Resealable plastic bag with 40 separated linking cubes (2 colors, 20 of each)

Note: When preparing these bags, be sure to use the same two colors for every partner pair. In the later lessons, partners will be combining their cubes to represent numbers more than 20 with a single color. In this lesson, students may choose to count by twos and fives, although this is not a first grade standard.

Students sit at their tables with their bags of linking cubes.

T: You will be making your own math tool kit today! Look

NOTES ON MULTIPLE MEANS OF REPRESENTATION:

As students are counting, circulate and observe their counting levels. Not all students may be able to switch between counting ones and tens. Take some extra time with the students who need to practice counting these patterns. Play some counting games with the linking cubes. You may also want to send home some counting activities for these students to play at home.
Lesson 1: Compare the efficiency of counting by ones and counting by tens.

Date: 3/13/14

in your bag. How many cubes do you think are in your bag?

S: (Look in bag and make prediction.)

T: Open your bag and count how many linking cubes there are.

T: Wow, there are a lot of cubes in our bags. What do you think is the best way to count them?

S: Count by ones.  Don’t count by ones. There are too many cubes.  Count them by twos.  We can put them in 5-groups and count by fives.  Put them in 5-groups and count them by tens!

T: Arranging these cubes in 5-groups is a great idea! Arrange your cubes, and then count to see how many cubes there are.

As students arrange their linking cubes and count, circulate, taking note of students’ methods.

T: How many linking cubes did you count?

S: 40 linking cubes.

T: Many of you did a great job putting your cubes in 5-groups and counting by fives or tens. Let’s count by ones to make sure we have 40 cubes.

T/S: (Count by ones.)

T: Now let’s count them by tens by making them into sticks of 10 cubes. Use the same color cubes for each ten-stick.

S: (Make 4 ten-sticks.)

T: Now that we have these ten-sticks, we can count by...

S: Tens!

T: Great! Point or move each ten to the side as you count.

S: 10, 20, 30, 40.

T: Did we still count 40 cubes?

S: Yes!

T: No matter how we count, by ones or by tens, we get to the same number. But which way was more efficient to count?

S: Organizing our cubes so we could count by tens was more efficient.

T: Also, sometimes when I count by ones and get distracted, I lose count. Then it takes even longer to count by ones because I have to start from the beginning again. But if I make tens, I wouldn’t have to start all over again.

T: (Show 12 scattered individual cubes on the projector. Have another scattered set of 12 individual cubes set aside for later.) How can I make these quicker to count?

S: Organize them into 5-groups.  Organize them into ten-sticks.

T: Let’s use ten-sticks. (Invite a student volunteer to demonstrate.)

T: Show me this same number of cubes using your own set. Organize them efficiently, like the ones on the board.

S: (Show one stick of 10 and 2 individual cubes.)

T: (Take out second set of scattered cubes.) Look at the 12 scattered cubes that I have and the 12 cubes you have in front of you. Which makes it easier for you to see 12 quickly?
Lesson 1: Compare the efficiency of counting by ones and counting by tens.

Date: 3/13/14

NOTES ON MULTIPLE MEANS OF REPRESENTATION:
As you are calling out numbers from 11 to 40 for students to show the number using their ten-sticks and extra ones in the suggested sequence: 3 tens 2 ones, 15, 25, 35, 3 tens 7 ones, 1 ten 7 ones, 1 ten 8 ones, 29, and 36.

Each time, have students create a number bond, representing the cubes that were grouped together as tens and the extra ones. Ask student volunteers to show how they counted their cubes to check their work. For example, for 35, one student may count, “10, 20, 30, 31, 32, 33, 34, 35.” Another student may count, “10, 20, 30, and 5 is 35.” Accept different ways of counting the ones, but always guide the students to count the tens first.

At the end of any lesson using the 40 linking cubes, students should regroup the cubes into 4 ten-sticks and store in the resealable bag for use during future lessons. These will become a part of their math toolkit for G1–Module 4.

Problem Set (10 minutes)

Students should do their personal best to complete the Problem Set within the allotted 10 minutes.

For some classes, it may be appropriate to modify the assignment by specifying which problems students should work on first. With this option, let the careful sequencing of the problem set guide your selections so that problems continue to be scaffolded. Balance word problems with other problem types to ensure a range of practice. Assign incomplete problems for homework or at another time during the day.

Student Debrief (8 minutes)

Lesson Objective: Compare the efficiency of counting by ones and counting by tens.

The Student Debrief is intended to invite reflection and active processing of the total lesson experience.

Invite students to review their solutions for the Problem Set. They should check work by comparing answers with a partner before going over answers as a class. Look
for misconceptions or misunderstandings that can be addressed in the Debrief. Guide students in a conversation to debrief the Problem Set and process the lesson.

You may choose to use any combination of the questions below to lead the discussion.

- Compare your answer to Problem 15 with your partner’s. Did you get the same answer? What are the parts of your number bond? Explain your thinking. (Accept any variation that aligns with the picture. For example, students may correctly bond as 20 and 10, or 30 and 0.)
- What did you do to solve Problem 16? (Similar to Problem 15, there may be multiple correct answers.)
- What are the different ways we can group objects to make counting easier?
- How does organizing objects in groups of 10 help us?
- How did the Application Problem connect to today’s lesson?

Exit Ticket (3 minutes)

After the Student Debrief, instruct students to complete the Exit Ticket. A review of their work will help you assess the students’ understanding of the concepts that were presented in the lesson today and plan more effectively for future lessons. You may read the questions aloud to the students.
